Alabama Soil Test Summary, July 1, 1975-June 30, 1980

Henry C. Williams, Clyde E. Evans,  
and Raymond A. Hoyum\*

Introduction

The Auburn University Soil Testing Laboratory has been in operation since 1953. The soil testing program in Alabama is a cooperative effort between the Alabama Cooperative Extension Service and the Alabama Agricultural Experiment Station. The Extension Service is responsible for distribution of soil test supplies, information, and education about soil testing. The Experiment Station is responsible for the research on which the lime and fertilizer recommendations are based, operates the laboratory, and makes the actual recommendations.

In addition to soil test recommendations for farmers and homeowners, soil test analyses for the Agricultural Experiment Station are also conducted in the Soil Testing Laboratory. A plant analysis service is also provided for pecan and fruit growers and for "trouble-shooting" fertility problems with all crops during the growing season.

Sample Numbers

The purpose of this summary is to present the soil test results of all soil samples for farmers and homeowners from July 1, 1975, to June 30, 1980. Because of the large number of soil samples analyzed, this summary shows trends have developed during the last 5 years in the fertility status of the agricultural soils in Alabama.

---

\*Graduate Research Assistant, and Associate Professor, Department of Agronomy and Soils, and Agronomist, Alabama Cooperative Extension Service, respectively.

The number of soil samples analyzed for farmers and homeowners increased steadily during the first 25 years of operation. The largest number of soil samples analyzed in a single year was 71,747 in the fiscal year beginning July 1, 1976, and ending June 30, 1977. (This did not include approximately 10,000 research soil samples that are analyzed each year for the Agricultural Experiment Station.) During the next 3 years (1977-1980), the Soil Testing Laboratory analyzed almost 60,000 soil samples per year for farmers and homeowners. The 10,000 fewer samples during these 3 years is attributed to a decrease of 7,300 soil samples for pasture and hay crops and a decrease of 4,200 soil samples analyzed for row crops, see tables 1-5.

Trends during the 5-year period, 1976-1980, show a 35 percent decrease in soil samples for corn, a 20 percent decrease in soil samples for cotton, a 6 percent decrease in soil samples for peanuts, but a 200 percent increase in the number of soil samples for soybeans. Soil samples for pasture and hay crops decreased 35 percent, and the number of soil samples for horticultural crops only increased slightly.

Of the total number of soil samples received by the Soil Testing Laboratory in 1979-80, 47 percent were for row crops, 28 percent were for pasture and hay crops, and 25 percent were for horticultural crops. In comparison, the percentages were 40, 38, and 22 percent, respectively, in 1975-76.

Tables 2-4 show where the soil samples came from by county and by districts of the Alabama Cooperative Extension Service. Table 5 shows the 12 counties that sent in the most soil samples for each year and for the 5-year period beginning July 1, 1975, and ending June 30, 1980. Houston County sent in over 5 percent of the soil samples during this

period and the top 12 counties sent in nearly 38 percent of the total number of soil samples.

#### Soil Fertility Results

The relative distribution of soil samples, according to the levels of phosphorus and potassium, are shown in figures 1-3. The total number of soil samples is divided into three crop groups: (1) row crops, (2) pasture and hay crops, and (3) horticultural crops. The actual percentages are shown in table 6 which also includes the levels of magnesium.

Except for horticultural crops, the soil samples testing Medium or lower in P or K need fertilizer and soil samples testing High or higher in P or K do not need fertilizer.

Tables 7-10 show the relative number of soil samples for each level of P, K, and Mg for each of four major row crops: cotton, corn, peanuts, and soybeans. These data suggest that soil-test P has decreased on cotton, corn, and peanut fields during the last 5 years while soil-test K has increased on cotton and corn fields. Since some marginal crop lands have been planted in soybeans in the last 5 years, it would be difficult to draw any conclusions except to say that a large number of soybean lands are deficient in P and K.

The levels of magnesium have increased on all field crop samples during the 5-year period. The increase in soil test Mg, shown in tables 7-10, and the pH data in tables 11 and 12, indicate that most farmers are following a good liming program.

### Fertilizer Ratios

One of the primary purposes of soil testing is to measure the fertility status of a given field and to make an appropriate fertilizer recommendation based on that measurement. Tables 13, 15, 17, and 19 summarize the number of soil samples according to their need for P and K fertilizer. Although the Soil Testing Laboratory recommends many different rates of  $P_2O_5$  and  $K_2O$ , an attempt is made to recommend these elements in only a few fertilizer ratios. For example, if one soil sample for soybeans tested Medium in P and Medium in K (P-K rating = M-M), then the fertilizer recommendation is 0-40-40. If another soil sample for cotton tested Low in P and Low in K (P-K rating = L-L), then the fertilizer recommendation would be 90-90-90. In both examples, the ratio of  $P_2O_5$  to  $K_2O$  is 1 to 1. This ratio is referred to as the P-K ratio. Most of the P-K ratios used by the Auburn University Soil Testing Laboratory are 1:1, 2:1, 1:2, 1:0, and 0:1. Only in a few instances, (for example, some horticultural crops) are other ratios recommended.

By restricting the number of recommended ratios of  $P_2O_5$  and  $K_2O$ , farmers and homeowners find it easier to purchase and apply fertilizer.

Tables 14, 16, 18, and 20 show that for all four major row crops where P and K fertilizers were recommended, the number of samples needing a 1:1, 2:1, and 1:0 ratio increased. This brings out a point that was discussed earlier: Soil-test P seems to be decreasing while Soil-test K seems to be increasing.

Tables 21 and 22 summarize the P-K ratios needed by various crops and crop groups in 1979-80.

Total samples needing fertilizer	4,604	100.0	6,725	100.0	6,963	100.0	8,485	100.0	9,437	100.0

\*Needed by those samples for which we recommend fertilizer.

Table 21. Number and Percent of Samples by Need of P and K Fertilizer,  
1979-1980

P or K fertilizer	Cotton		Corn		Peanuts		Soybeans		Total row crops		Pasture and hay		Total agronomic	
	Number	Pct.	Number	Pct.	Number	Pct.	Number	Pct.	Number	Pct.	Number	Pct.	Number	Pct.
Recommended	2,932	70.0	6,786	73.1	3,708	92.0	9,437	88.5	22,863	81.2	14,072	82.2	36,935	81.5
Not recommended	1,259	30.0	2,497	26.9	322	8.0	1,228	11.5	5,306	18.8	3,053	17.8	8,359	18.5
Total samples	4,191	100.0	9,283	100.0	4,030	100.0	10,665	100.0	28,169	100.0	17,125	100.0	45,294	100.0

Table 22. Number and Percent of Samples Needing P and K Fertilizer  
By Crop and By P-K Ratio Recommended, 1979-1980

P-K Ratio	Cotton		Corn		Peanuts		Soybeans		Total row crops		Pasture and hay		Total agronomic	
	Number	Pct.	Number	Pct.	Number	Pct.	Number	Pct.	Number	Pct.	Number	Pct.	Number	Pct.
1-1	890	30.4	1,620	23.9	1,305	35.2	3,315	35.1	7,130	31.2	3,878	27.6	11,008	29.8
2-1	377	12.8	972	14.3	476	12.8	1,626	17.2	3,451	15.1	2,906	20.6	6,357	17.2
1-2	96	3.3	195	2.9	453	12.2	721	7.6	1,465	6.4	894	6.3	2,359	6.4
1-0	590	20.1	2,912	42.9	392	10.6	1,448	15.3	5,342	23.4	3,622	25.7	8,964	24.3
0-1	979	33.4	1,087	16.0	1,082	29.2	2,327	24.6	5,475	23.9	2,772	19.7	8,247	22.3
Total samples	2,932	100.0	6,786	100.0	3,708	100.0	9,437	100.0	22,863	100.0	14,072	100.0	36,935	100.0

Table 23. P-K Ratios Needed for Various P-K Ratings  
For Most Crops

P-K ratio	P-K rating combinations
1-1	VL-VL, VL-L, L-VL, L-L, M-M
2-1	VL-M, L-M
1-2	M-VL, M-L
1-0	VL-H, VL-VH, L-H, L-VH, M-H, M-VH
0-1	H-VL, H-L, H-M, VH-VL, VH-L, VH-M, EH-VL, EH-L, EH-M
0-0	H-H, H-VH, VH-H, VH-VH, EH-H, EH-VH
