1984 Alabama Cotton Variety Report

A Report of the Performance of Cotton Varieties Tested in Alabama

W. C. Johnson and Darrell Williams¹

INTRODUCTION

The Alabama Cotton Variety Test is a continuing evaluation of available cotton varieties from private companies and state agricultural experiment stations. Breeding lines that are likely to be released as varieties are also tested. Tests are conducted on units of the Alabama Agricultural Experiment Station by Experiment Station personnel. Cultural practices are those generally recommended by Auburn University to farmers. Every effort is made to test the varieties and present the results in an unbiased manner.

EXPERIMENTAL CONDITIONS

A randomized block experimental design with four replications was used at each location. Plot row length at different locations varied from 40 to 120 feet. Plots were two-row at Prattville, Headland, Belle Mina, and Crossville. Single-row plots were used at the other locations. Climatic conditions were near ideal for cotton production as indicated by an average yield of 1,130 pounds lint per acre for all 1984 variety tests in Alabama.

EXPLANATION OF DATA

Harvest of Seed Cotton

Tests at Prattville, Brewton, Monroeville, Talladega, Belle Mina, and Shorter were harvested by a mechanical spindle picker. Tests at Headland

¹Respectively, Professor and Research Associate of Agronomy and Soils.

and Crossville were harvested by hand. Average yield of seed cotton was determined for each variety at each location.

Lint Percentage

A sample of seed cotton from each variety at each location was taken at harvest and ginned on a 10-saw gin. Lint percentage was calculated by dividing weight of lint by weight of seed cotton. Lint percentage may be higher than that obtained at commercial gins because the 10-saw gin has no cleaning equipment.

Yield of Lint

Lint yield was determined by multiplying the lint percentage by yield of seed cotton.

Fiber Properties

Fiber qualities of all varieties from selected locations were determined by Starlab, a commercial fiber testing laboratory in Knoxville, Tennessee.

Span Length. This is the fiber length measured with the digital fibrograph. The 2.5 percent length is the average length of the longest 2.5 percent of the fibers and the 50 percent length is the average length of the longest 50 percent of the fibers. Their ratio is an expression of the fiber length uniformity. The 2.5 percent length is about the same as the classer's staple.

Stelometer. T_1 is a measure of breaking strength of a standard fiber bundle with the holding jaws separated by 1/8 inch. This is a measurement similar to Pressley strength except the figures are in grams per tex. Tex is a size measurement of the fiber bundle. The larger the T_1 , the stronger the fibers. E_1 measures the percentage stretch before the fibers break.

Micronaire. This measures the fineness and maturity of the cotton fibers. The smaller the micronaire reading, the finer and/or more immature the fibers. The desirable range of micronaire is 3.5 to 4.9.

Earliness

Where more than one harvest was made, earliness is reported as the percentage of the total yield harvested at the first picking.

Fusarium wilt

Reaction of varieties to Fusarium oxysporum f. vasinfectum (fusarium wilt) was evaluated at the Plant Breeding Unit, Tallahassee. The varieties were grown in a field with a high natural incidence of the fusarium wilt disease. Severity of the disease varies from year to year and also within the experimental area in the same year. Therefore, several years' data are necessary to realistically characterize a variety's wilt reaction. Stoneville 213 and Stoneville 825 have consistently shown a high incidence of wilt. All other reported varieties that have been tested for at least 3 years have acceptable tolerance to fusarium wilt.

NEW AND EXPERIMENTAL VARIETIES

PD 4548 is an experimental line from the Pee Dee Experiment Station, Florence, South Carolina, that has just been released as a variety and named PD-1. Breeder seed are available from the Pee Dee Experiment Station. Deltapine 50 is a new variety, released in 1985, which we have tested several years. Deltapine 69, previously designated Deltapine 733, has been released but seed are not yet generally available. Deltapine 102 is an advanced experimental strain. Coker 81-102 is a high quality advanced strain which has not been released and for which seed are not yet available. GAT 72-56 is an experimental strain from Tifton, Georgia, and

Acala SJ C-1 and Paymaster 145 are varieties adapted to the Western United States. These are included in certain Alabama tests as part of a national variety testing program.

STATISTICAL ANALYSIS

Appropriate analyses of the yield data were made. For each location, the variability in the test was measured and expressed as a percentage of the test mean, i.e., the coefficient of variation (C.V.). An indication of the magnitude of difference between variety averages necessary to be considered a real difference is given for each location. It is designated Least Significant Difference (L.S.D.) .05.

LOCATIONS OF EXPERIMENTS

Tennessee Valley Substation, Belle Mina - W. R. Webster, Superintendent

Sand Mountain Substation, Crossville - J. T. Eason, Superintendent

Prattville Experiment Field - D. P. Moore, Superintendent

E. V. Smith Research Center, Shorter - W.B. Gordon, Superintendent

Plant Breeding Unit, Tallassee - S.P. Nightengale, Superintendent

Brewton Experiment Field - J. R. Akridge, Superintendent

Monroeville Experiment Field - J. R. Akridge, Superintendent

Wiregrass Substation, Headland - H.W. Ivey, Superintendent

RECOMMENDED COTTON VARIETIES FOR ALABAMA

The list of recommended varieties given below was prepared by a committee composed of the authors of this report and Dr. Louie J. Chapman, Head of Extension Agronomy, Alabama Cooperative Extension Service, based on variety test performance for at least 3 years. Varieties differ in performance at individual locations, so selection should be based largely on variety performance at a site that most nearly represents the grower's local situation. The recommended varieties are listed in order of 3-year average lint yield.
