to race, color, sex, or national origin.

ACKNOWLEDGMENTS

Appreciation is expressed to Mein-Huei Tzeng and Mrs. Sally Bagwell, Research Data Analysis, for the computation and summarization of data in this report.

Appreciation is also expressed to the following cooperators in charge of their respective substations whose support is gratefully acknowledge:

NORTHERN ALABAMA

Tennessee Valley Substation, Bell Mina	-	W.B. Webster, Supt.
		H.E. Burgess, Assoc. Supt
Sand Mountain Substation, Crossville	-	J.T. Eason, Supt.
		M.E. Ruf, Assoc. Supt.
Upper Coastal Plain Substation, Winfield	-	W.A. Griffey, Supt.
		R.A. Moore, Jr., Supt.
		(Retired)

CENTRAL ALABAMA

Black Belt Substation, Marion Junction	-	J.L. Holliman, Supt.
		M.D. Pegues, Asst. Supt.
		H.W. Grimes, Supt.
		(Retired)
Prattville Experiment Field	-	D.P. Moore, Supt.
Piedmont Substation, Camp Hill	-	J. Owen, Supt.
		W.A. Griffey (Relocated)
Plant Breeding Unit, Tallassee	-	S. Nightengale, Supt.

SOUTHERN ALABAMA

Brewton Experiment Field	-	R. Akridge, Supt.
Monroeville Experiment Field	-	R. Akridge, Supt.
Gulf Coast Substation, Fairhope	-	E.L. Carden, Supt.
		R. McDaniel, Assoc. Supt.
Lower Coastal Plain Substation, Camden	-	J.A. Little, Supt.
Wiregrass Substation, Headland	-	H.W. Ivey, Supt.
		L.W. Wells, Asst. Supt.

THE 1989 ALABAMA SMALL GRAIN VARIETIES

FOR FORAGE PERFORMANCE COMPARISON

Donald L. Thurlow and W.C. Johnson¹

INTRODUCTION

The large number of commercially available varieties of wheat, oats, rye, barley, and triticale makes it difficult for growers to select varieties most suited for forage production in their particular area of the State. Many of the small grain species and varieties differ in their capability to produce early fall and winter forage for livestock production. Making the proper selection requires up-to-date, unbiased, reliable information and varietal forage yield by season.

Data from tests conducted at 12 locations were used to compile this report and they represent the varied growing conditions around the State for the past 3 years.

Procedure

The experiment design for the tests was a split plot design with species as the main plot and varieties as subplots. Plots were 5 feet by 20 feet with rows spaced 7 inches apart. A cone drill was used to plant all tests. Each variety was replicated three times in each test.

The tests are normally planted in late September to early October. However, in 1987 only the tests at Tallassee and

¹Associate Professor and Professor of Agronomy and Soils.

Headland were planted October 1 and 9, respectively. All other locations in 1987 were planted in late October to early November because of dry conditions. All test locations were planted at normal times of late September and early October in fall of 1986 and 1988. The tests were fertilized at planting with 100 pounds N per acre and clipped with a flail-type mower each time they reached 6 inches in height. A sample was weighed green from each plot, then dried and reweighed. The percent dry matter figure from these weights was used to calculate forage dry matter per acre. The test was topdressed in February with 60 pounds N per acre and continued to be clipped until no regrowth occurred in the spring.

DATA EXPLANATION

Dry matter forage is recorded for seasonal and total yields by locations. The four seasonal periods are autumn, fall forage produced through December; winter, January and February production; early spring, March and early April production; and late spring, production after April 20.

DISCUSSION

Growing conditions and variety forage performance often vary among locations and years. Multiple-year averages are given here to use as a better indicator for performance comparison.

VARIETIES RECOMMENDED FOR FORAGE ONLY

Variety recommendations for the three regions are based on 3-year regional averages of full-season forage yield in tables 1, 5, and 10. Varieties are listed in descending order of yield.

*If present trends continue, this variety will be removed from the recommended list for forage only next year in the region indicated.

**Conditionally recommended on 2 years' data.

For those who wish to harvest grain following grazing, varietal selection should be from those varieties recommended either for grain or for forage. Some varieties are recommended for both uses, but if not, the relative importance of forage or grain to the individual farmer should be the major consideration for varietal selection.
