PERFORMANCE OF SOYBEAN VARIETIES IN ALABAMA, 1991

D.L. Thurlow, W.C. Johnson, and K.M. Glass<sup>1</sup>

INTRODUCTION

Soybean variety tests are conducted annually by the Alabama Agricultural Experiment Station. The 10 locations used represent the major soil and climatic regions of Alabama. These locations are divided into logical soybean growing regions. The regions and locations are:

<u>Region</u>	<u>Location</u>
Northern	Belle Mina, Crossville
Central	Camden, Prattville
Southern	Brewton, Headland, Monroeville
Black Belt	Marion Junction (2 soils)
Baldwin-Mobile	Fairhope

A standard test is grown at each location. In addition, a late date-of-planting test is grown in each region, an early date-of planting test is grown at Brewton, and preliminary tests are grown in the northern, central, and southern regions. The preliminary tests contain advanced experimental lines and released varieties which are new to that particular region. If performance warrants, these varieties will be placed in the standard test in subsequent years.

Soybean row spacing research in the Southeast has not shown much advantage for narrow row spacing over the conventional row width of 36 to 40 inches for standard planting dates. Two row

<sup>1</sup>Respectively, Associate Professor, Professor, and Technician of Agronomy and Soils.

spacing tests were conducted at two locations, E.V. Smith Research Center, Shorter and Tennessee Valley Substation, Belle Mina, using 18 cultivars. The purpose was to evaluate the effect of row width on soybean yields when planted later than standard planting for full season production. The four row spacings used were 9, 18, 27, and 36 inches.

#### EXPERIMENTAL PROCEDURES

The standard tests were designed as a randomized complete block with four replications. Plot size was four 24- to 36-inch rows 20 feet long. Sixteen feet of the middle two rows were harvested for yield. Seeding rate was 10 viable seeds per foot of row. The preliminary tests were planted in a randomized complete block design with three replications. The early and late planting date tests were arranged in incomplete lattice square designs, with 16 and 9 entries per maturity group and four replications, respectively.

Two planting dates were used for the tests at Crossville, Prattville, Brewton, Marion Junction (Vaiden Soil), and Fairhope. An entry must perform well in the early standard test before it is entered in the late date test. Results are reported by planting date in the tables, with date 1 being the standard full season planting and date 2 the later planting at all locations.

Six cultivars from each of three Maturity Groups were used to study the effect of row spacing on late planted soybeans. Maturity Groups V, VI and VII cultivars were used at Belle Mina, and Maturity Groups VI, VII, and VIII cultivars were used at

Shorter. A split-split plot design with four replications was used at each location. The main plot was row spacing with the sub-plot being Maturity Group and sub-sub-plot being cultivar.

Data were collected on seed yield, moisture, lodging, shattering, plant height, and maturity date. Plot yields were adjusted to 13 percent moisture and converted to bushels (60 pounds) per acre. Lodging was scored on a scale of 1 to 5 as follows:

- 1 - almost all plants erect.
- 2 - either all plants leaning slightly (less than 45°) or a few plants down.
- 3 - either all plants leaning moderately (approximately 45°) or 25 to 50 percent of the plants down.
- 4 - either all plants leaning more than 45° or 50 to 80 percent of the plants down.
- 5 - more than 80 percent of the plants down.

Shattering was rated on a scale of 1 to 5 based on performance of the border row 14 days after maturity. A rating of 1 indicates no shattering, a rating of 3 indicates a 4 to 8 percent shattering, and a rating of 5 is 20 percent or more shattering. Plant height was determined by measuring from the ground to the top of the plant at maturity. Maturity date was the day 95 percent of the pods reached mature pod color.

Harvest was approximately 7 to 10 days later.

#### SEASONAL CONDITIONS

Rainfall (table 3) in April and May 1991 was such that all standard tests were planted for optimum growth. The late

planting tests at Marion Junction and Fairhope were delayed approximately 2 weeks due to heavy rainfall in June and July at both locations. The normal planting dates for full season plantings in the regular tests are the first week in May, May 15-25, and May 25 to June 5 for northern, central, and southern Alabama locations, respectively. The rainfall for 1991 was above normal in May at all locations and was generally adequate for vegetative growth through July in central and southern Alabama. However, rainfall was limiting during July, August, and early September in northern Alabama resulting in lower yields on early varieties and early planting dates. Rains in mid-September helped the Maturity Group VII varieties.

#### COMPARING VARIETIES

To aid in determining real yield differences, a statistical analysis of variance is performed on the data from each location. The L.S.D. (least significant difference) and C.V. (coefficient of variation) are given for each location's 1991 test, and for the location's or region's 2- and 3-year averages. The difference in yield of two varieties must exceed the L.S.D. value for one variety to be considered superior to the others in yield in that particular test. The C.V. is a measure of the variability in an experiment. An increase in its value indicates an increase in the unexplained variability.

Since the performance of varieties varies with location and year, long-term averages from several locations are more reliable than 1-year performance. Three-year regional averages are

#### ACKNOWLEDGMENTS

Appreciation is expressed to the following station superintendents and their staffs. It is their quality work which makes this report a reliable source of information for farmers in their areas.

Black Belt Substation Marion Junction	J.L. Holliman J.R. Harris
Brewton and Monroeville Experiment Fields Brewton and Monroeville	J.R. Akridge
Gulf Coast Substation Fairhope	E.L. Carden N.R. McDaniel M.D. Pegues
Lower Coastal Plain Substation Camden	J.A. Little P.A. Rose
Prattville Experiment Field Prattville	D.P. Moore
Sand Mountain Substation Crossville	J.T. Eason M.E. Ruf
Tennessee Valley Substation Belle Mina	W.B. Webster Ellis Burgess B.E. Norris
Wiregrass Substation Headland	H.W. Ivey Larry Wells Brian Gamble

Appreciation is also expressed to Mien-Huei Tzeng and Mrs. Sally Bagwell, Research Data Analysis, for the computation and analysis of the data in this report.

considered a reliable evaluation of the relative performance of varieties.

A committee comprised of Department of Agronomy and Soils personnel involved in soybean extension and research reviewed the past 3 years of soybean variety test data to assemble the list of recommended varieties on page 44. The acceptable varieties are not all equal in performance. Some are outstanding in one or more characteristics; while others may possess a satisfactory, although not outstanding combination of all characteristics.

Perrin	24.7	-	-	1.9	-	-	26	-	-
Kirby	22.4	-	-	5.1	-	-	22	-	-

<sup>1/</sup>Chlorosis ratings were 1-10, with 1 being no chlorosis and 10 being plants that were losing leaves due to necrotic spots in leaves.

<sup>2/</sup>2-yr. and 3-yr. averages are 1989 and 1991 and 1988-89 and 1991, respectively.

## RECOMMENDED SOYBEAN VARIETIES FOR 1992

This is a list of recommended varieties was prepared by the authors of this report, D. B. Weaver, Associate Professor of Agronomy and Soils, and J. B. Henderson, Agronomist-Soybeans, Alabama Cooperative Extension Service, based on variety test performance for at least 3 years.

### Northern Alabama

<u>Early</u>	<u>Full Season</u>	<u>Late</u> (Late Plantings)
Coker 485	Bryan	*Braxton
*Deltapine 105	Centennial	Pioneer 9791
Deltapine 415	Hartz H 6686	Stonewall
*FFR 561	Hy Performer HSC B2J	
*FFR 565	*Leflore	
Forrest	*Northrup King S69-54	
Hartz H 5164	Pioneer 9641	
Hutcheson	Pioneer 9691	
*Pioneer 9591	Riverside Cajun	
Riverside 577	Sharkey	
Terra-Vig 515	Tracey M	
	Twiggs	

### Central Alabama

<u>Very early</u>	<u>Early</u>	<u>Full season</u>	<u>Late</u>
Bay	**Brim	*Braxton	Cobb
Coker 485	*Davis	*FFR 771	Johnston
Deltapine 105	*Leflore	Gordon	
Deltapine 415	Northrup King S69-54	Stonewall	
FFR 561	*Pioneer 9691	Wright	
Forrest	Tracey M		
Hutcheson	Twiggs		
*Terra-Vig 515	Young		

(Continued on following page)

Black Belt (acid soil)

<u>Very early</u>	<u>Early</u>	<u>Full season</u>	<u>Late</u>
Coker 485	Centennial	*Braxton	Cobb
Deltapine 105	Davis	Coker 6847	Johnston
Deltapine 415	Deltapine 726	Colquitt	
Hartz 5164	Hartz 6372	**Hagood	
Narow	**Hartz 6686	**Hy Performer	
**Riverside 577	*Leflore	HSC 721	
Terra-Vig 515	Pioneer 9641	Pioneer 9791	
	Riverside Cajun	Ransom	
	*Sharkey	Riverside 757	
	*Tracey M	Stonewall	
	Young		

Southern Alabama

<u>Very early</u> (early May planting)	<u>Early</u>	<u>Full season</u>	<u>Late</u>
Coker 485	Davis	Braxton	Cobb
Deltapine 105	Hartz 6686	Coker 6847	Johnston
Deltapine 415	Northrup King	FFR 771	
Hartz H 5164	S69-54	Pioneer 9791	
Pioneer 9591	**Pioneer 9641	Riverside 757	
Riverside 577	*Sharkey	Stonewall	
Terra-Vig 515	Terra-Vig 616		
	**Young		

Baldwin-Mobile

<u>Very early</u>	<u>Early</u>	<u>Full season</u>	<u>Full season, late</u>
Coker 485	**Brim	Braxton	Johnston
Deltapine 105	**Bryan	Coker 6847	
Forrest	**Deltapine DP 3627	**Hartz H 7190	
Hartz H 5164	Hartz H 6372	Pioneer 9791	
	Hartz H 6686	Riverside 757	
	*Leflore	Stonewall	
	Lloyd	Thomas	
	Northrup King		
	S69-54		
	**Pioneer 9691		
	Sharkey		
	*Twiggs		
	Young		

\*If present trend continues, these varieties will be dropped from recommended list.

\*\*Recommended based on an exceptional 2-year average.

\*\*\*Recommendations based on past late April planting, no test in 1991.
