## PERFORMANCE OF GRAIN SORGHUM HYBRIDS IN ALABAMA, 1986

W. C. Johnson and D.L. Thurlow<sup>1</sup>

### INTRODUCTION

Grain sorghum performance tests are conducted annually throughout Alabama by the Alabama Agricultural Experiment Station. These tests give a comparison of hybrid performance under the conditions at a particular location. The locations used represent major soil and climatic areas of the State. The performance of hybrids varies with location. Therefore, this report should be carefully studied before a hybrid is selected.

### EXPERIMENTAL PROCEDURES

Cultural practices were uniform for all hybrids within a given test. The experimental design for all tests was a randomized complete block with four replications. Test plots were two 36-inch rows, 20 or 30 feet in length. The target plant population was 60,000 plants per acre, with a seeding rate 25 percent higher to ensure a good stand. Test cultural practices are listed in table 1.

Grain yields were obtained by harvesting the whole test plot with a plot combine, and adjusting harvested grain weight and moisture to a standard 14 percent moisture and 56 pounds per bushel.

Lodging is given as the percentage of plants broken or leaning at an angle of more than 45 degrees. The seedheads of lodged plants were not included in the yields reported.

Days to mid-bloom is one measure of relative maturity. This is taken as days from planting to the date when approximately one-half of the heads in the plot are in bloom.

---

<sup>1</sup> Professor and Associate Professor of Agronomy and Soils.

The preliminary grain sorghum hybrid test, table 14, is used to evaluate new hybrids and experimental lines. If a new hybrid does well in the preliminary test, it is planted in the regular test the next year.

Bird damage at the Tennessee Valley Substation, Belle Mina, was heavy. Damage was concentrated on the earlier maturing hybrids. Bird damage was also heavy at Prattville and relatively uniform. Damage was light at the other test sites. Bird damage can be a problem in small fields. In selecting a hybrid, consideration should be given to bird populations; if damage is anticipated, bird-resistant hybrids should be used. Bird-resistant grain sorghum hybrids are sometimes difficult to market and may have lower feed value than the non-bird-resistant hybrids.

Yields were severely reduced at the Wiregrass Substation, Headland, by a severe infestation of green-bugs as the grain of most hybrids was maturing.

#### VARIETY COMPARISONS

The performance of hybrids varies among years and locations. Small yield differences among hybrids may be the result of slight environmental or cultural differences rather than differences in yield potential among hybrids. To aid in determining real differences, a statistical analysis of variance was performed on the data from each location. The L.S.D. (least significant difference) at the 5 percent level is reported to help determine real differences between hybrid yields for each location in 1984. If the yield difference is greater than the L.S.D. value between two hybrids at a given location, the two hybrids are considered to be significantly different in yield. The C.V. (coefficient of variation) is a measure of test variability. An increase in its value indicates a decrease in the precision of the test data.

The list of acceptable hybrids is based on 3-year-average grain yield and lodging data. The list is divided into three regions, north, central, and south. Since all acceptable hybrids are not equal in performance, a review of the data from several years at the test location similar to your situation is the most reliable method for selecting a hybrid best suited for your farming needs.

Anthracnose has become a major factor in grain sorghum production in Alabama. This past growing season, outbreaks of this disease were very sporadic. In 1985, however, grain sorghum in many northeast and west central Alabama counties was devastated by anthracnose. Some fields yielded 50 to 75 percent less grain than expected. Feed quality of much of the harvested grain from diseased fields was also very poor. Resistant grain sorghum hybrids have been the best defense against anthracnose. Of available adapted grain sorghum hybrids, Funk's G-1711 and Pioneer Brand 8333 have the best resistance to this disease. Other hybrids with some anthracnose resistance are DeKalb DK-64, Paymaster 1022, Northrup King 2244, Coker 7737, and Pioneer Brand 8222. Good management plus disease resistant grain sorghum hybrids are necessary to reduce losses to anthracnose.

Many pesticide chemicals can be phytotoxic to a particular crop species as was the case in 1986 at Monroeville when the Grain Sorghum Variety test was sprayed for the control of midge. There was some residue of methyl parathion in the sprayer used. The reaction by some sorghum hybrids was a color change from green to almost orange followed by leaf death. The severity of damage was rated for each hybrid. Average ratings along with corresponding yields are shown in table 15.

There was second or ratoon crop of sorghum harvested November 6 at the Wiregrass Substation, table 16.

Plant height of grain sorghum hybrids is reported as regional averages (central, northern, southern) and single locations of Marion Junction and Fairhope, table 17.

#### ACKNOWLEDGMENTS

The performance trials were conducted in cooperation with the following substation and experiment field superintendents and their staffs whose quality work makes this report a reliable source of information for farmers in their areas.

##### Northern Alabama

Tennessee Valley Substation, Belle Mina - W. B. Webster, V. H. Calvert, II

Sand Mountain Substation, Crossville - J. T. Eason, M. E. Ruf

Upper Coastal Plain Substation, Winfield - R. A. Moore, Jr.,

##### Central Alabama

Black Belt Substation, Marion Junction - H.W. Grimes, J. L. Holliman

Prattville Experiment Field, Prattville - D. P. Moore

E. V. Smith Research Center, Shorter - W. B. Gordon

##### Southern Alabama

Monroeville Experiment Field, Monroeville - J. R. Akridge

Wiregrass Substation, Headland - H. W. Ivey, L. Wells

Gulf Coast Substation, Fairhope - E. L. Carden, N. R. McDaniel, M.D. Pegues

Appreciation is also expressed to W. H. Hearn, C. Jacks, and Sally Bagwell, Research Data Analysis, for the computation, summarization, and analysis of the data in this report.

Table 1. Locations and Cultural Practices for the 1986 Grain Sorghum Hybrid Tests

Location	Planting date	Nitrogen rate	Plant population	Harvest date	Herbicides	Insecticides
Tennessee Valley Substation (Belle Mina)	May 14	120	60,000	August 18	Atrazine <sup>1</sup>	Nudrin
Sand Mountain Substation (Crossville)	May 16	125	60,000	August 25-26	Atrazine	Lannate Furadan
Upper Coastal Plain Substation (Winfield)	April 30	120	60,000	August 20	Atrazine	None
E. V. Smith Research Center (Shorter)	May 20	125	60,000	August 27	Atrazine & Dual	None
Prattville Experiment Field (Prattville)	May 26	120	60,000	August 26	Atrazine	Nudrin Lorsban
Black Belt Substation (Marion Junction)	June 3	120	60,000	September 23	Atrazine	None
Monroeville Experiment Field (Monroeville)	May 15	120	60,000	August 28-29	Atrazine	Sevin <sup>2</sup>
Wiregrass Substation (Headland)	April 17	100	60,000	July 23	Atrazine	Malathion
Gulf Coast Substation (Fairhope)	May 18	120	60,000	August 7	Atrazine	None

<sup>1</sup>/ All Atrazine was applied broadcast when the sorghum was approximately 4 inches high.

<sup>2</sup>/ Small amount of methyl parathion was in airplane spray tanks and caused considerable damage to some varieties.

Terra brand hybrids.....	Terra Seed Company P.O. Box 10121 Lubbock, TX 79408

ACCEPTABLE HYBRIDS FOR 1987

All acceptable hybrids have been tested for 3 consecutive years in the region listed. All of the acceptable hybrids are not equal in performance. It is suggested that this report be carefully studied before choosing a hybrid. The hybrids are listed in descending order of 3-year-average yield for each region.
